
Subject: Widget problem in PV-Wave 6.1

I am experiencing a curious problem that surfaced when I "upgraded" to Wave 6.1. In 6.05 my checkboxes had checks in them and my radiobuttons were round. In 6.1, the checks are missing and the radiobuttons are back to the good ol' diamond shape. I have the proper settings in my .Xdefaults file and the program even recognizes these settings using WwResource.

Has anyone else had similar problems?

I have also experienced other strange widget behavior that did not occur in 6.05. Tech support says nothing has changed from 6.05 to 6.1 that would cause this behavior. But I beg to differ.

My programs were running fine. I "upgraded" to a new version. My programs are no longer running fine. Nothing else changed. So why is it unreasonable for me to think it is **their** problem and not mine? I for one don't think it is, but I get the impression that tech support wishes I would quit bothering them (i.e., I caused the problem, or better yet, I **am** the problem)

I think I have been reading too much Alan Cooper, thanks to David Fanning.
