The way I do this is the following:

```
pro testEvent, event

type = tag_names(event, /structure)
if type eq 'WIDGET_TRACKING' then begin

;process the tracking event
if event.enter eq 1 then $
    print, 'You just entered the Draw widget $
else $
    print, 'You just left the draw widget'

endif else begin

;process other events here

endelse
end

pro widgetTest
    base = widget_base()
    draw = widget_draw(base, xsize=20,ysize=20,/tracking)
    widget_control, base, /realize
    xmanger, "test", base, event_handler = "testEvent"
end
```

Hope this helps,
Phil
