If you have a array, x, of 50 numbers

x = randomn(seed,1,1,50)

and an array,z

z = fltarr(500,1000)

and you want to put the values of x in a row of z starting at (300, 525) you can write

z[300:349,525] = x

I am just guessing that this is what you might want, because your question is not very clear.
