I recommend looking at the documentation in MPFITFUN.pro & VOIGT.pro &

https://en.wikipedia.org/wiki/Voigt_profile#Relation_to_Voigt_profile

I'll probably end up with something like this, but check the derivatives

before using AUTODERIVATIVE=0 or PARINFO[i].MPSIDE = 3.

You can do this manually or using

```
; PARINFO[i].MPSIDE = 3 ; Enable explicit derivatives
; PARINFO[i].MPDERIV_DEBUG = 1 ; Enable derivative debugging mode
; PARINFO[i].MPDERIV_RELTOL = ?? ; Relative tolerance for comparison
; PARINFO[i].MPDERIV_ABSTOL = ?? ; Absolute tolerance for comparison
for more details see the documentation in MPFIT.pro
```

I hope this works, beyond compiling I have not debuged it.

Good luck, Markus

```
function voigt_wrapper, x, p, dp
  voigt, p[1]/(sqrt(2)*p[0]),x/(sqrt(2)*p[0]),h,f
  if n_params() gt 2 then begin
    requested=dp
    dp = make_array(n_elements(x), n_elements(p), value=x[0]*0)
    if requested[0] ne 0 then $
      dp[*,0]=-p[2]*(p[1]*f-x*h)/(sqrt(2)*dpi)*p[0]^3
    if requested[1] ne 0 then $
      dp[*,1]=-p[2]*( (2*p[1]-h)/(sqrt(2)*dpi)*p[0]^2 $
        -(p[1]^2*h+2*x*f*p[0]-x^2*h)/p[0]^3 )
    if requested[2] then ne 0 dp[*,2]=-1/(sqrt(2)*dpi)*p[0]*h
    if requested[3] then ne 0 dp[*,3]=1d
  endif
```

```
    return, p[3] - p[2]/(sqrt(2*!dpi)*p[0])*h  
end
```

```
p0=[sigma0,gamma0,norm,cont]  
p_out = MPFITFUN('voigt_wraper', x, y, err, p0)
```
