Can someone explain to me the following behavior or is this a bug? I am trying to catch an error in my idlbridge object, but this fails (put in C:\test\test.pro):

```
pro test2
on_ioerror, jmp
openr, unit, 'nothing', /get_lun ; provoke error
jmp: return
end
```

```
pro test
a = obj_new('idl_idlbridge')
a->execute, 'cd, "C:\test"' ; make sure idlbridge knows this file
a->execute, 'resolve_routine, "test"'
a->execute, 'test2' ; the error does not get caught and execution halts here
end
```
