
Subject: Calling IDL display from C, on Unix

Hi.
Does anyone know ... ?

If I do prefer calling IDL functions from my C routines, instead of calling my C routines from IDL, could you please teach me how to do that ?

I was able to use "tv", but was never successful to use "tvscf".
I also need to grab the true image coordinates(image coordinates of a pixel, in the original image size domain before image size scaling) of the location of cursor (picked by mouse) on the image displayed by "tvscf".

I heavily use matrix computation that is one of the reason why I hesitate to use CALL_EXTERNAL.

Thanks in advance.

Ohig Kwoun
