
Subject: 2 cent tip: Faster way to plot millions of points

Sometimes we need to plot spectra which contain millions of points. It appears to be faster to use PLOTS (rather than PLOT).

Try the following:

```
n = 1000000L
x = lindgen(n)
y = sin(2.0*pi*findgen(n)/(n-1))
t0 = systime(1.0) & plot,x,y & print,systime(1.0)-t0
t0 = systime(1.0) & plot,x,y,/nodata & plots,x,y & print,systime(1.0)-t0
```

On my SGI Power Indigo running IDL 5.0, it takes 21.43 sec for the first plot, and 12.46 sec for the second plot. I observe similar speedups on Linux (IDL 5.0) and Windows NT 3.51 (IDL 4.0.1).

Cheers,
Liam.
