Subject: Color separation with IDL
Posted by Miska Le Louarn on Tue, 08 Jul 1997 07:00:00 GMT

Hello everybody !

I would like to print an image to a slide. To do that, I need a color
separated version of this image, i.e. three images, each containing the
Red, Green or Blue component of the image to be printed.

Then I could save these 3 images into a single TIFF file, using the
planarconfig keyword, and send the image to the printing company...

So would any of you know how to do this color separation ? I would
think it should be fairly simple to do, but I don't know how to get
started !

Thanks in advance,

Miska Le Louarn

PS : I'm using IDL 5.0 on a SUN workstation...
