
Subject: IDL 4.0 on HP-UX 10.2 - Problems with TVSCL

We had IDL 4.0 running on our HP-UX 9.05 server. We never had any problem running our IDL applications either at the HP-UX server's console or on xterm clients attached to the server.

We recently purchased faster HP machines. These machines are running HP-UX 10.2. We still have IDL 4.0 on this new server.

When we launch our IDL applications from the new server's console, we have no problem. However, when we launch our IDL applications from an xterm client, the application starts of right, and we get the user interface displayed right on the xterm's monitor. But the application hangs on the TVSCL and TV commands. No IDL or Xwindows error messages show up.

Any one experience some thing similar? Any suggestions greatly appreciated.

Thanks

ratty
