Subject: Interpolating missing or masked data in IDL

I am using INTERPOLATE to do a bi-linear interpolation on a geo-located grid, in order to create a slightly smaller grid. However, my grid has a land mask built into it. The land flag is a unique value, but the interpolation results in the coastal boundaries being extended slightly seaward in the new grid. Has anyone found a convenient way to account for land (or for that matter, missing data values) when running the interpolation?

Thanks, Jim Firestone
