It would be *really cool* to have an IDL function that works
like:

play_sound, filename, sample_rate

where the filename refers to an ascii file that is simply a
column of numbers.

I don't think something like this exists in v. 4.0.1, but
I don't know about v. 5.0

If something like this existed, then I would certainly use
it. I've had to come with other workarounds to play my sound
samples (which I originally generated in IDL).
