It depends on what kind of layout you want to create. For example, if you
create a row/column layout with a border, all the widgets inside this
layout will automatically have a border, even though you set the border
width to 0.

To get rid of this, you can create a FORM layout instead of ROW/COLUMN
layout. If you define a border on this FORM layout, all the widgets
inside this layout won't have border unless you specify that these
widgets should have a border around them. It works fine for me.

Hope this help !!

KP.
