Subject: trouble with windows
Posted by Mirko Vukovic on Tue, 02 Sep 1997 07:00:00 GMT

By now it must be evident to the whole wide world that I am finally
doing some IDL programming and coming up with questions (and I thought
that I was profficient in IDL)

(This question comes after browsing through help and faq.)
(idl 5.0.2 on windows95)

I am switching between two windows in a loop and incrementally
(over)plotting on each a series of curves on each. When I am done with
the loop and at the exit I want to overplot a summary curve on the
first window, it looks as if all the information about the plot
scalings is from the _second_ window.

Storing and then recalling !p,x,y does the trick, but why does the
problem appear only at the last curve?

tia,
