
Subject: NT IDL Crashes

Hi All,

I'm running IDL5.2 under windows NT4.0(sp4) and I am getting fed up with the number of IDL program crashes (about 3-6 a day). They happen both during program code execution and also just during editing in the IDLDE. Doesn't kill NT, just IDL, however I never had this experience on UNIX (admittedly using IDL4).

Is this a typical experience of windows users ? or should I have my head (or at least hardware) examined!

(anyone from RSI listening?)

Martin
