Subject: delete key in IDLDE (IRIX 6.3)

IDL users running idlde in IRIX,

This is most annoying. How do I get the delete key to act like a normal delete key (delete characters ahead of cursor position) rather than like the back space key which is what it now does when editing *.pro files?

I am using the C-shell (/bin/csh) with nothing changed in my .cshrc file affecting this (it has remained the default file so far).

Rich
