to all

has anyone figured out ENVI's "infeasibility" value? It is in the  
Select Spectral Tools > Mapping Methods > Mixture Tuned Matched  
filtering.

The manual doesn't help and like many things in ENVI/IDL I question the  
mathematics. I would love to know how this number is calculated. Right  
now it seems like a fudge factor variable, but I don't know.

Any help would be appreciated.

Kent
