<html>

Howdy,

<p>Last week I had asked how to get the symbol objects associated with a IDLgrPolyLine or IDLgrPlot to use the colors specified in the Vert_Colors keyword. RSI tech support kindly provided the answer...

<p>To plot 10 (or some number) symbols, each with its own color, I must define 10 different symbols. The Symbol field of IDLgrPlot and IDLgrPolyLine may contain on or more instances of symbol definitions.

<p>I often use the color of a plot symbol as a representation of some nominative value (like 'Gravel' or 'Rockweed') superimposed upon spatial info (like X, Y and depth.)

<p>Whew!

<p>Ben
