Subject: high priority interrupt event

Is there any way to send a high priority event, say from an button widget, and have it interrupt time consuming processes like draws ?

Our IDL application controls some servo motors via socket coomunication. When the app is "executing" a process, the procedure goes into a loop and I do check for other events at the beginning of this loop :

```
ev = WIDGET_EVENT(sState.wEStop, /NOWAIT)
```

and then check a common block variable to see if the estop button was pressed.

But, later in the loop, a `sState.oWindow->Draw,sState.oView` is issued which can take minutes. Can I somehow break this call if the estop button was pressed ??

Something like raising a signal and catching it in a handler ?

Thanks in advance

Rich
