
Subject: Messy output in profiler

Hi,

Does anybody have some formatting code for the IDL profiler?

If I ask the profiler to output the results to a variable

```
profiler,/report,output=log
```

then it splits things into the log-variable in a way that is very difficult to use. Sometimes an element contains just the name of the procedure. Sometimes it contains the record of how much it was used. Sometimes it contains the usage statistic plus the name of the next routine.

Is there some simple command that would re-format the output?
