
Subject: idl_motif keymap complains <- help

I am having trouble running the motif version of IDL under OPENLOOK with SUNOS 4.1.2. (IDL. Version 3.1.1 (sunos sparc).) When I use (for example) the xinteranimate widget I get complaints about unknown keysym names. In particular:

```
-----  
Warning: translation table syntax error: Unknown keysym name: osfLeft Warning:  
... found while parsing '<Key>osfLeft: DrawingAreaInput()  
ManagerGadgetTraverseLeft()' Warning: translation table syntax error: Unknown  
keysym name: osfRight Warning: ... found while parsing '<Key>osfRight:  
DrawingAreaInput() ManagerGadgetTraverseRight()'  
-----
```

Here is the advice I get from RSI. Can someone explain this to me? The [System Wide] option is not a viable solution for me (seems pretty half-baked) and I already have the [Per User] part in my .cshrc.

```
-----  
from sun_motif.doc in IDL distribution:  
-----
```

Keysym problems

```
-----
```

When running the motif version of IDL on a remote Sun server (i.e. not directly logged onto the system) you might see a screenful of messages referring to unknown osf keysyms. These messages are harmless, but annoying. We have found that either of the following two solutions clears this problem up.

[Per User] Have each user put the following line in their .cshrc file:

```
% setenv OPENWINHOME /usr/openwin
```

[System Wide] Have your system administrator issue the following command on the system with the OpenWindows server:

```
% ln -s /usr/openwin/lib /usr/lib/X11
```

--

```
      0  
_____/_____  
aric _ (>(>)
```
