Subject: Breakdown after 10 min: IDL + WinNT

Hi, an IDL beginner needs help!

With a 1-month test license I have spent several hours on the following
problem:

After 10 minutes of operation, IDL52 breaks down. (WinNT 4.0, Service
Pack 4, 64MB RAM). Dr.Watson says:
"IDL: Ausnahmefehler (Exceptional Error?) 0xc0000095 at address
0x20051ef1"
It is reproducible!
I cleaned the Registry; I startet "UnInst.exe -fc:\rsi\deisl2.isu"; I
deleted \rsi\idl52.
After new installation from CD the same: 10 minutes...

(In June 99 I had a first test license, It worked well)

Kind regards

Hans-Jurgen Hahne

Forget the books. Grab RedHat 6.1 and go. You won't regret it.

How about avoiding such problems by never running libc5 exes on a libc6
system? IDL works just fine. I've not found a problem with anything
else I use.

X setup on a non-standard machine (e.g. laptop) can occaisinally be
"not for the faint-hearted". Mostly, I've not had problems, especially
with newer distributions.

And I'm more than happy to trade in a little set-up time for a stable,
reliable platform, that doesn't require a reboot every
10*RANDOMU(seed) hours.
