
Subject: Widget_Droplist kills Windowmanager

Hi all,

I am encountering the following problem... a droplist widget in IDL freezes my entire window manager the moment it is clicked on. The corresponding event handler is not even entered (I placed a stop at the start of the handler). It does not depend on the window manager or X server (I am running Linux). I cannot get the windowmanager re-activated, even after IDL is killed. On the other hand, it seems to happen only in that particular widget constellation...

Anybody encountered anything similar?

M. Feldt
