Hi,

I was very surprised and afraid this morning about the definition changes of possible signs on tagname definitions.

The only non_alphanumeric signs which are allowed in the new version is '\$' and '_'.

The '!' sign is only defined for the first place.

```
a=create_struct('test@core',1)
% CREATE_STRUCT: Illegal tag name: test@core.
% Execution halted at: $MAIN$
```

I have had no information about such changes I don't found any hint's in the what's new topics.

I like to have back the possibility to use each sign to define a tagname.

R.Bauer
