Hi all,

I was wondering if anyone has successfully created a MS Windows DLL for use as an IDL DLM using the port of the GNU gcc/g77 compiler to Windows (cygwin, <http://sourceware.cygwin.com>). I have a large Fortran application with a C wrapper function that I use as a DLM under Linux with no problems. The cygwin package compiles all the code, but I cannot get it to link into a DLL. If anyone has a working Makefile, I appreciate a copy.

Thanks,

-bob mallozzi
