You are gonna have to bite the bullet and redo your interface. If you have written your interface and callback code in an object-friendly, re-usable fashion, this won't be too painful. You'll just strip out the code that does the actual crunching and display, and call it from the web browser ION interface. Doesn't have to be a full-blown java applet; depending on your interface behavior and attributes it could be as simple as some HTML forms.
