Hi,

I hate using forloops; does anyone know a better way of implementing the following code without forloops?

Thanks in advance

```
for column = 0, size1(1) -1 do begin
  for row = 0, size1(2) -1 do begin ;
    print, '-----'
    print, b
  end
end
end
```

Sure.

```
print, rebin( b, size1(2) -1, size1(1) -1 )
```

All your code above does is print b over and over again - why clutter it all up with the '-----' string?? :o)

paulv

p.s. apologies for the frivolity, but it's not coffee-time yet....sigh.
