Subject: Animating in Color Posted by Rachel on Thu, 06 Jul 2000 07:00:00 GMT

Is there an easy way to animate a series of color images in IDL other than a simple for loop from the command line? I was trying to use XINTERANIMATE but could only make it do black and white. The images are plotted on the screen then read into an array with tvrd(true=3). I can get them to redisplay in color, but not as an animation in Xinteranimate. Thanks for any advice.

Rachel
