Hi folks,

I have simple question:

I create a Heap variable of int array called `Im_arr`, and create a pointer to the heap variable `Im_arr`. Now I spawn a C-code that will read an image from a camera. I pipe the pointer to `Im_arr`, to the spawned process.

Here is question : Can use the pointer value from IDL as pointer in C-code to write image data directly to the heap variable `Im_arr`???

any suggestions that I can do above operation or some thing like that???

thanks in advance????
