
Subject: Plotting with two y axes

I have time series data with different units (e.g. one set will be measured in feet, another with units of cfs). I plot several of these sets on one plot. If there are two different units I draw a second y-axis on the right side with the appropriate scale, so the second set will show properly. I save the new scale with /save on the 'axis' command.

Now if I plot a third set of data, but with the same units as the first set (left y-axis), the scale isn't correct. I fix it by changing the values of the data to scale properly. But isn't there some simpler way than rescaling the data itself?
