
Subject: cursor return in graphics window

Hi all,

I am trying to use cursor to return the coordinates of a mouse click in a graphics window. In fact I am trying to do it twice, back to back, and am running in to the problem that one mouse click is being read by both cursor calls. I want to select two points with the mouse in the graphics window but since one mouse click is being read by both cursor calls I am getting the same coordinates for each. I have tried playing with the wait keyword in cursor but that doesn't seem to make a difference.

Any suggestions? I am doing this on a Mac right now but have the same problem on my Solaris boxes.

Thanks

Eric Williams
