Subject: how can I implement arcsinc

I would like to create an x = asinc(y) function to solve sinc(x) = y, where sinc(x) = sin(x)/x, over the interval x=[0,pi]. I looked at IDL's non-linear solvers, but they require creating a function sinc(x) - y first. I guess it's possible to create a function from within a function, but it's none too elegant. Does anyone know of a better way?
