This will only work if you're the owner of the file in question.

Is it the system defaulting to read-only output, or are the users themselves setting the files as read only?

If it's the former, then change the system default, or get people to stick a "umask" command in their login script (sorta like a chmod but opposite).

If it's the latter, ask them not to do it. :o)

to change unix file attribute from idl :

```
spawn,'chmod 777 file'
```

and don't forget about the unix sudo utility. this will help if the person isn't the owner.
