
Subject: Background colors in PNG files?

Is there some way to control the background color when writing to a PNG file so it appears consistently (independent of the viewer application)? I write PNG files using code that works fine for GIFs and Postscript files, but the background color in the PNGs seems to change every time the file is viewed (or reloaded if using a browser). I'm assuming that this is a problem with PNG, but I'm also hoping that someone has found a way to solve it. Thanks.
