
Subject: IDL private color maps in X

This question concerns how idl controls shared color maps.

I am using idl on a SUN IPX with 8bit color graphics. I am running idl under X using the X11R5 twm window manager. My questions:

Is it possible to force idl to use a private colormap without first grabbing the shared color map with another application?

Can idl be switched to a private map after the first window is opened (with the shared colormap)?

Feedback is greatly appreciated

Sincerely,
Evan Fishbein
