
Subject: IDL vs Matlab for Visualization

Now that version 6 of Matlab with it's improved tools for volume visualization has been out for a bit I am hoping that someone can provide some feedback on how it stacks up to IDL for segmentation and visualization of data sets. I am specifically interested in: ease of development, speed of execution, availability of tools for image segmentation (I know that 3rd party toolboxes are needed in Matlab), and any other comments that people experienced in the field might have.

Thanks!
