
Subject: 24 vs 8 bit color systems

Hello All,

This is a bit of a departure from the normal request for help. I am getting ready to begin designing (aka programming) my final project for my IDL programming class. I have read through Dave Fanning's book and since I wasn't sleeping, Dave's not so subtle message about differences between 8 and 24 bit displays became apparent. :-)

However, (and this is the point of this post) I got to wondering just how much of an issue this really is in today's environment. I suspect, and would like feedback, that it is rather uncommon now-a-days to find an IDL user who is working on an 8-bit color display. I assume that if one can afford IDL, then one can also afford a "decent" graphics card. I ask this question, because I would like to make the going in assumption that the user of my project will be working on a 24 bit system. Is this a "bad" assumption to make (i.e. are there still a significant number of users still running on 8 bit systems?)

Thanks in advance,
Jason Meyers
