Subject: Probably a simple question, but I'm only a beginner with this IDL stuff :)

---

I have read in an array from a file its an xyz image (three chanel pixel interleaved)  
however it is defined from the top row of the image rather than the bottom as IDL defines it... If it were a two dimensional array it would be easy to rotate/flip it  
however I cant work out how to flip it and all my pictures are coming out upside down :(

Can someone please point me in the right direction on flipping it vertically :)

TIA

Chris Bull
