EMACS: CTRL+G will let you enter a line number to jump to. At least, thats my key-bindings. If you use emacs, I can let you know how to bind a key to the goto-line command.

IDL-WAVE (EMACS): CTRL+G, unless you are going to a line because of an error, in which case it is automatic.

VI: ": q <RETURN> emacs <RETURN>" is the best way to edit files in vi.

PICO: only allows line-number specification upon opening of file

% pico +nnn file_name

nano, an improved pico clone, allows jump-to, i believe.

IDLDE: CTRL+G. I've never used IDLDE, so i don't know how/if this works.

hope this helps.

Control-G ? Isn't that the "cancel request" keystroke? I do it all the time, it makes emacs beep, and annoys the heck out of my office-mates.

Craig

In the mini-buffer, its "cancel request". But in a main window edit
buffer, its "goto-line". Depends where you are...

-k.

Well, this is not the standard setting - so you or your Sysadmin must
have done this. C-g normally does nothing except canceling whatever
you are doing. If you are doing nothing, it just beeps, as Craig
describes.

XEmacs 21.1 has goto-line standard on M-g
Emacs 20.6 has no standard binding to goto-line. To get it on M-g
like in XEmacs, put this into .emacs.

```
(define-key global-map "\M-g" 'goto-line)
```

Hope this helps

[snip]

Correct. My original post stated "At least, thats my key-bindings".
