Dear all,

I have started using idlde under RedHat 6.2 on the gnome desktop.
I am experiencing two quite annoying problems, which I hope that you can solve for me:

1) Sometimes idlde just dies on me. In particular, when I have changed the current program elsewhere, am prompted to reload, and click accept. This kills the session immediately.

2) In my programs I frequently spawn a postscript viewer like
`spawn,unit=a,"/usr/bin/X11/gv "+outfile`
where a is some unit and outfile is the file I just wrote.
This works fine, but when I close gv I am left with a "defunct" tcsh hanging around. If I spawn with /noshell, it is a defunct gv that is left. Not even "kill -9" works!! I need to exit IDL to get rid of them.

Emailed replies would be appreciated.
Thanks for any help!! /Ole, Danish Meteorological Institute
