Oh, Matlab is more widely available on university systems, I'll concede that. :-)

Cheers,

David

It depends 75 % on what system your faculty staff expect you to use. They may have a preferred platform for lab assignments etc.

It depends 20% on the range of tasks you want to get into. Matlab may be stronger in numerical modelling. IDL may be stronger in imaging and visualisation. I say maybe, because for every specific example, someone from the "other" side will be able to produce a counter example. Both packages probably have far greater capabilities than you are likely to exercise in undergrad years.

The remaining 5%? Try a few tasks at the command line; try a simple tutorial. Which one feels best to you?

Regards,

Michael Asten
