Hi all -- first I'd like to say THANKS! You all have been an excellent help to a lowly undergrad trying to write some cool code. With the help of David's XPlot routine I have my first object graphics program working well (bet you didn't know you'd be aiding an investigation of Jovian trapped particle radiation when you wrote that did you David?... not so suprising though, its utilitarian code: lots of applications.) Now for time series plots. I'd like to be able to do a variable number of them per page (I used to do this with !p.multi and they came out real pretty). Can anyone point me to some source code or an illustrative example?

My regards -- Luke

PS. David you'll definately be thanked and acknowledged in my thesis and software documentation, as will all the authors of Open Source software that I use. Hey! How's the object graphics book coming along? I'd buy one.
