---

How would I go about displaying velocity field plots using object graphics ?

The IDL routines are all direct graphics based (like VELOVECT, VEL)

On a similar note, has anyone developed algorithms they are willing to share which develops

velocity field plots based on image subtraction. ie. where several images in a series show moving isothermal contours in a temperature image, I would like to display at each time point a velocity field of the thermal conduction flow direction.

Its a long shot but I'll ask anyway.

Thanks

Rich
