
Subject: double integration in IDL....

I have a fortran routine which does double integration. I am trying to rewrite this routine in IDL, and would also like to use IDL's array based functionality, to speed up the integration. Has any of you written code in IDL to perform double integration using IDL's array based functionality. If so, could you please share with me your IDL coding style.

I apologize for not posting my problem in a clear fashion, but I am just hoping that there is someone out there who had a similar problem, and is able to understand what I am talking about. I want to perform the integration without any FOR loop.

Thanks for your help....
