Hi,

I've only started using IDL recently, and was wondering if anyone can help me out.

I need to produce a data file which steps through increments of time (1.04906 s) for an entire day, i.e. to produce a file which looks like:

00:00:01.04906

00:00:02.0992

...

...

23:59:59....(whatever the last integer would be!)

Can anyone help out, but more importantly, does anyone understand what the hell I'm going on about!!

Cheers for your time,

Manish.
