Greetings.

I use the esrg package (espacially the function tvim) to plot my data as images. I used the NODATA and the RGB_NODATA keyword to archieve, that pixel with the value NODATA will be displayed in the color specified by RGB_NODATA - in my case [255,255,255].

The colortables I'm using go from green over yellow to red. In the ps-file I'm making pixel with the value NODATA are now plotted in the last color of the colortable (in this case red), although they ought to be white.

If anybody understood what I was just saying, pleas help.

thanks

lasse clausen
