In the GUI-builder (WINDOWS platform) I have a Text Window.

I want to write two strings at two lines using SET_VALUE.

```
WIDGET_CONTROL, wText, SET_VALUE='TEXT Line1'+STRING(10B)
+'STRING(13B)+'TEXT Line2'
```

Of some unknow reason the ASCII cod for carriage return and new line does not have any effect other than writing a symbol(a straight line). I

get the two

text strings at the same line. Any suggestion to how to get them on two lines in the window?
