Hi,

At the moment I am most need fast batch jobs for graphics output.

I am interested in Object graphic for visualisation of 3d or 4d datasets.

Because I wish to use the mouse to control the views in case of rotation and may

be some cuttings and so on. But if I know which kind of view I prefer for the output then I believe a batch job should do the print outs or animation of several same organized data sets.

How much data could be handled quite good ?

Do you have some experience in problems which may occure?

I know the object model by idl but in the past it

frigthens me by the output sizes and the speed of a simple direct graphics plot

seen in object graphics. A simple colored XY plot of about 30KByte was about a few MegaBytes in Object Graphics.

How did this change the /vector Keyword?

Do you have some examples?

In the past there was direct graphics much faster than object graphics.

Is this changed?

I like to know how fast it is to plot

100, 1000, 10000 100000 or 1 million points with a dot or a line symbol by object graphics.

thanks for your help

regards

Reimar
