
Subject: Is there any "Dataminer" out there?

Hello all,

after a few days of experience I try to write my first functions for easy handling of data stored in ODBC-sources. I think I have a good idea in what direction I should go but discussion with people who already have experience with the two objects IDLDBDatabase and IDLDBRecordset would be nice.

I already tried to find functions related to these topics in some of the available IDL-resources (libraries) but without success.

I for myself find this way of accessing large amounts of data rather easy and straightforward. I can encourage everybody to use this approach although the implementation of ODBC-access seems to need some additional features (could be also my lack of experience in IDL-programming...)

Your comments?

Olaf,
with best wishes for the coming weekend!
