Hello,

I'm a very beginner with IDL so I'm sorry if my question is too stupid.

I need to store a object reference in an object structure:

```
pro my_obj__define
  struct = {my_obj, another_obj:OBJ_NEW()}
end
```

After another_obj is zeroed during object creation, it couldn't no more be used as an object reference!!

I've tried to redeclare it

```
another_obj=OBJ_NEW()
```

but the problem remains.

It's an IDL bad limit, or my error?

Thank you,

Francesco Belletti
