Having only been on a 1 day course on ION Script I am probably not the best  
qualified to answer this.

However one difference between your code and the examples is that you are  
using Mouse.X rather than Mouse.x.

I did write some programs which did get the mouse position so if necessary I  
could try to find them.

Thank you this did make a difference. Also I had to make another page call this one before it worked so that is also something to consider. The mouse values come from the previous page.
